

F-Secure Mobile Security™ for Windows Mobile

1. Installing and Activating

Previous Version If you have a previous version of F-Secure Mobile Security installed, you must close it. The previous version is removed automatically during the installation.

Installing **To install:**

1. Transfer the .cab installation file to your device.
2. Locate and select the .cab file in File Explorer on your device.
3. Select **Yes** to allow the installation if you are prompted to do so.
4. Select **Yes** to agree to the license terms and conditions.
5. After installing the application, you are prompted to restart your device. Select **Yes**.
6. When the installation is ready, you need to activate the product. The product does not protect your device if you have not activated it.

Activating **To start the activation:**

1. Select **Yes** on the activation notification that appears when you switch your device on for the first time after installing F-Secure Mobile Security.
2. Select the activation type:
 - To start the evaluation period, select **Free Evaluation** and select **Next**, OR
 - To have the fully licensed version, select **Subscription Number** as the activation type, and select **Next**. Enter your subscription number and select **Next**.
3. Select **Yes** to connect to the update service. The application connects to the update service and submits your subscription number. During the first update, the application downloads the latest virus definition database.
4. When the download is complete, a message informs you that the registration was successful and that the application is activated. Select **OK** to finish the activation.
5. After you have finished the activation, scan your device for viruses to make sure it is clean. See the [Scanning for Viruses](#) section for more information.

If you have a valid subscription code and you are currently using the free trial version of the application, go to the *Buy* menu and enter your subscription code to activate your subscription.

Starting the Product

After you have activated F-Secure Mobile Security, it starts up automatically every time you turn on your device:

1. If you are using Windows Mobile Professional or Classic, select **Start→ Programs→  Mobile Security**.

If you are using Windows Mobile Standard, select **Start→  Mobile Security**.

2. Select **Yes** if you are prompted to run a virus scan.

2. Scanning for Viruses

F-Secure Mobile Security works in the background and scans your files automatically when the real-time scanning is on.

1. If a virus is found during the real-time scan, a message is displayed. Select **Yes** to view infected files, or **No** to close the view.
2. The Infections view contains a list of infected files on the device. For each item on the list, the state (quarantined, released) and the name of the infected file are displayed.
3. Select the infected file to view more details about it.
 - If you are using Windows Mobile Professional or Classic, tap **Show details**.
 - If you are using Windows Mobile Standard, select **Menu→Show details**.

Processing Infected Files

To process infected files:

1. In the main view, open **Virus Protection**.
2. In the *Virus Protection* menu, select **Infected files**.
3. In the *Infected files* view, select the infected file to be processed.
4. Choose one of the following actions:
 - **Delete** - delete the infected file. This is the recommended option. The file will be removed completely from your device.
 - **Quarantine** - quarantine the infected file if it is not quarantined already. A quarantined file is locked and cannot harm your device when F-Secure Mobile Security is on.
 - **Release** - release the quarantined file. If you release a file, it will not be locked any more. You access it at your own risk.

If you are using Windows Mobile Professional or Classic, tap the softkey.

If you are using Windows Mobile Standard, select **Menu** and choose the action.

3. Preventing Unauthorized Network Traffic

The firewall in F-Secure Mobile Security works quietly in the background. It monitors incoming and outgoing Internet and network traffic, and protects you from intrusion attempts. The predefined firewall levels allow you to instantly change the level of protection according to your needs.

Selecting Security Level

To select the security level:

1. In the main view, open **Firewall**.
2. In the Firewall menu, select **Settings**.
3. Choose one of the following firewall levels:
 - **Deny All** - stops all network traffic.
 - **High** - allows most commonly used applications and blocks all incoming traffic.
 - **Normal** - allows all outgoing connections and blocks all incoming traffic.
 - **Allow All** - allows all network traffic.
 - **Custom** - allows network traffic based on your custom rules. To edit the custom rule set, select **Edit custom rules** when the **Custom** security level is selected.

4. Protecting Confidential Information

With Anti-Theft, you can make sure that your device or data stored on it is not misused if your device is stolen.

As memory cards can be easily removed, store your confidential information in the device memory.

Security Code

You can use the security code to remotely locate, lock or wipe your device.

The security code needs to be at least 8 characters long. Use a code that is easy to remember but hard to guess. Store the security code in a safe place.

Remote Anti-Theft

With the remote locator, you can send an SMS message to your lost device to locate it.

With the remote lock, you can lock the device remotely by sending it an SMS message you have created. To use the remote lock, keep the device lock turned on.

With the remote wipe, you can wipe the device remotely by sending it an SMS message you have created. When the device is wiped, all data stored on it is removed.

To set up remote Anti-Theft:

1. In the main view, open **Anti-Theft**.
2. In the Anti-Theft menu, select **Settings**.
3. Select which features you want to turn on:
 - If you want to be able to locate your device remotely, select **Enable locator**.
 - If you want to be able to wipe your device remotely, select **Enable remote wipe**.
 - If you want to be able to lock your device remotely, select **Enable remote lock**.

You can enable the remote lock only when the device lock is turned on.

4. Enter your **Security code** and type it again to confirm it.

To locate, lock or wipe your device remotely:

- To locate the device, send the following SMS message to your device:
#LOCATE#<security code> (For example: #locate#12345678)
- To lock the device, send the following SMS message to your device:
#LOCK#<security code> (For example: #lock#12345678)
- To wipe the device, send the following SMS message to your device:
#WIPE#<security code> (For example: #wipe#12345678)

SMS Alert

Anti-Theft can alert you if somebody changes the SIM card in your device. To use the SMS alert, turn on the **SMS alert when SIM changed** setting and specify the phone number where the SMS text message should be sent when the SIM card in the device is changed.

5. Protecting web browsing

Browsing Protection protects you from web sites that may steal your personal information, including credit card numbers, user account information, and passwords.

Browsing Protection checks web sites that you browse with Internet Explorer. Browsing Protection is turned on automatically after you have activated F-Secure Mobile Security if Internet Explorer is set as your default browser. If you use any third-party browser, Browsing Protection does not protect your web browsing.

To set up Browsing Protection:

1. In the main view, open **Browsing Protection**.
2. In the Browsing Protection menu, select **Settings**.
3. If you want to turn on Browsing Protection, select **Enable Browsing Protection**.
4. In **Network to use**, select whether you want to use Browsing Protection all the time or only when you are browsing the web on your own operator's network:
 - Select **My operator only** to use Browsing Protection only when you are using your own operator's network.
 - Select the **All operators** setting to keep the protection turned on when you are travelling and outside of your own operator's network.

6. Keeping the Product Up-to-Date

Automatic Updates

F-Secure Mobile Security includes an automatic update service, which means that the virus definition database in the application is updated regularly. Only an up-to-date virus definition database protects your device against the latest viruses. Automatic updates are in use after you have activated the product.

The application requires an active Internet connection for the updates. When a connection to the Internet is available, the application checks when the virus definition database was last updated and downloads new updates if necessary.

Manual Updates

You can also update the application and the virus definition database manually:

1. Select **Menu→Update** on the main view.
2. Select **Yes** to confirm that you want to retrieve the latest update.
3. If a new application update is available, select **Yes** when you are prompted to download it.
4. When the update is finished, select **Yes** to scan your device for viruses. See the *Scanning for Viruses* section for more information.

For More Information

For more information, download the User's Guide for your product (available in English) at <http://mobile.f-secure.com/>.

Technical Support

If you have questions about the application not covered in the guides or in the online services at <http://mobile.f-secure.com/>, you can contact your local F-Secure distributor or F-Secure Corporation directly.
